PERSAT FINANCE · PERSAT LABS

You shouldn’t have to sell what you own just because **you need liquidity.**

Testnet is live. Early users are in.
Mainnet is three disciplined steps away.

NEGOTIATE. LEND. EARN.

WHY

The choice feels **violent.**

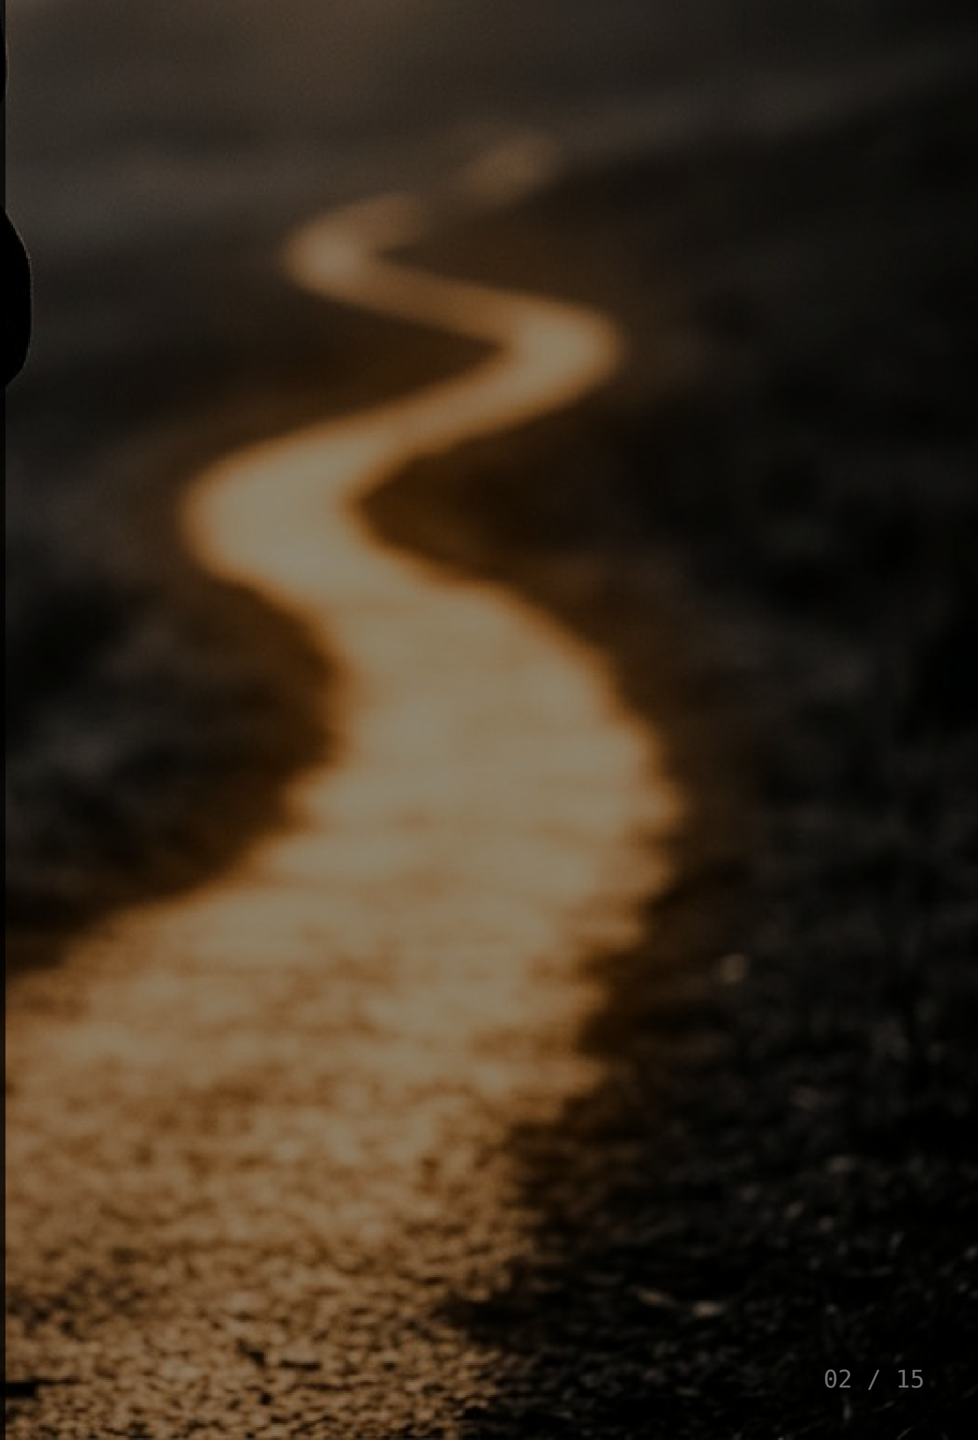
A Bitcoin holder needs rent. An emergency hits. An opportunity appears.

Sell the asset you believe in — or go without.

Someone else has capital and wants to earn. Lending without trust is a gamble with no enforcement.

The world doesn't lack assets or capital. It lacks infrastructure that lets them meet without surrender.

This is not a feature gap. It is a human dignity gap.



THE SCAR

We’ve already seen what “trust me with your coins” costs.

- Centralized lenders asked for custody. History answered with freezes, failures, and vanished access.
- Celsius-class failures didn’t just lose money — they broke the story of being “safe” in crypto.
- The question that built Persat: why should liquidity require giving up control?
- Answer: non-custodial vaults, onchain agreements, collateral in cryptographically enforced structure.

ONE PROBLEM · TWO SIDES

Same wound.
Two stomachs.

Borrower

- I hold value. I need cash. I refuse to sell my future.
- Selling under pressure abandons a thesis — not “taking profit.”
- I will not hand my stack to a black box to feel liquid.

Lender

- I have capital. I want yield with spine.
- No vibes, DMs, or promises without collateral and rules.
- I need discovery, verification, and enforcement — not hope.

Persat is the infrastructure between them.

IDENTITY

The marketplace and trust layer for §onchain credit.

- Peer-to-peer by design — people still meet; the protocol enforces the deal.
- Two doors, one lifecycle — private direct deals + open marketplace.
- Discovery · negotiation · collateral · escrow · terms · settlement · repayment · liquidation.
- We don’t eliminate the relationship. We give the relationship armor.

BTC collateral · tBTC / zBTC | Loans · USDC / USDT | Solana · non-custodial

HOW IT FEELS

From need → capital
without the surrender.

01 Connect wallet. State what you need — or what you'll lend.

02 Agree terms with a counterparty (private link or marketplace).

03 Lock eligible BTC-collateral in a non-custodial vault.

04 Fund. Activate. Live the loan.

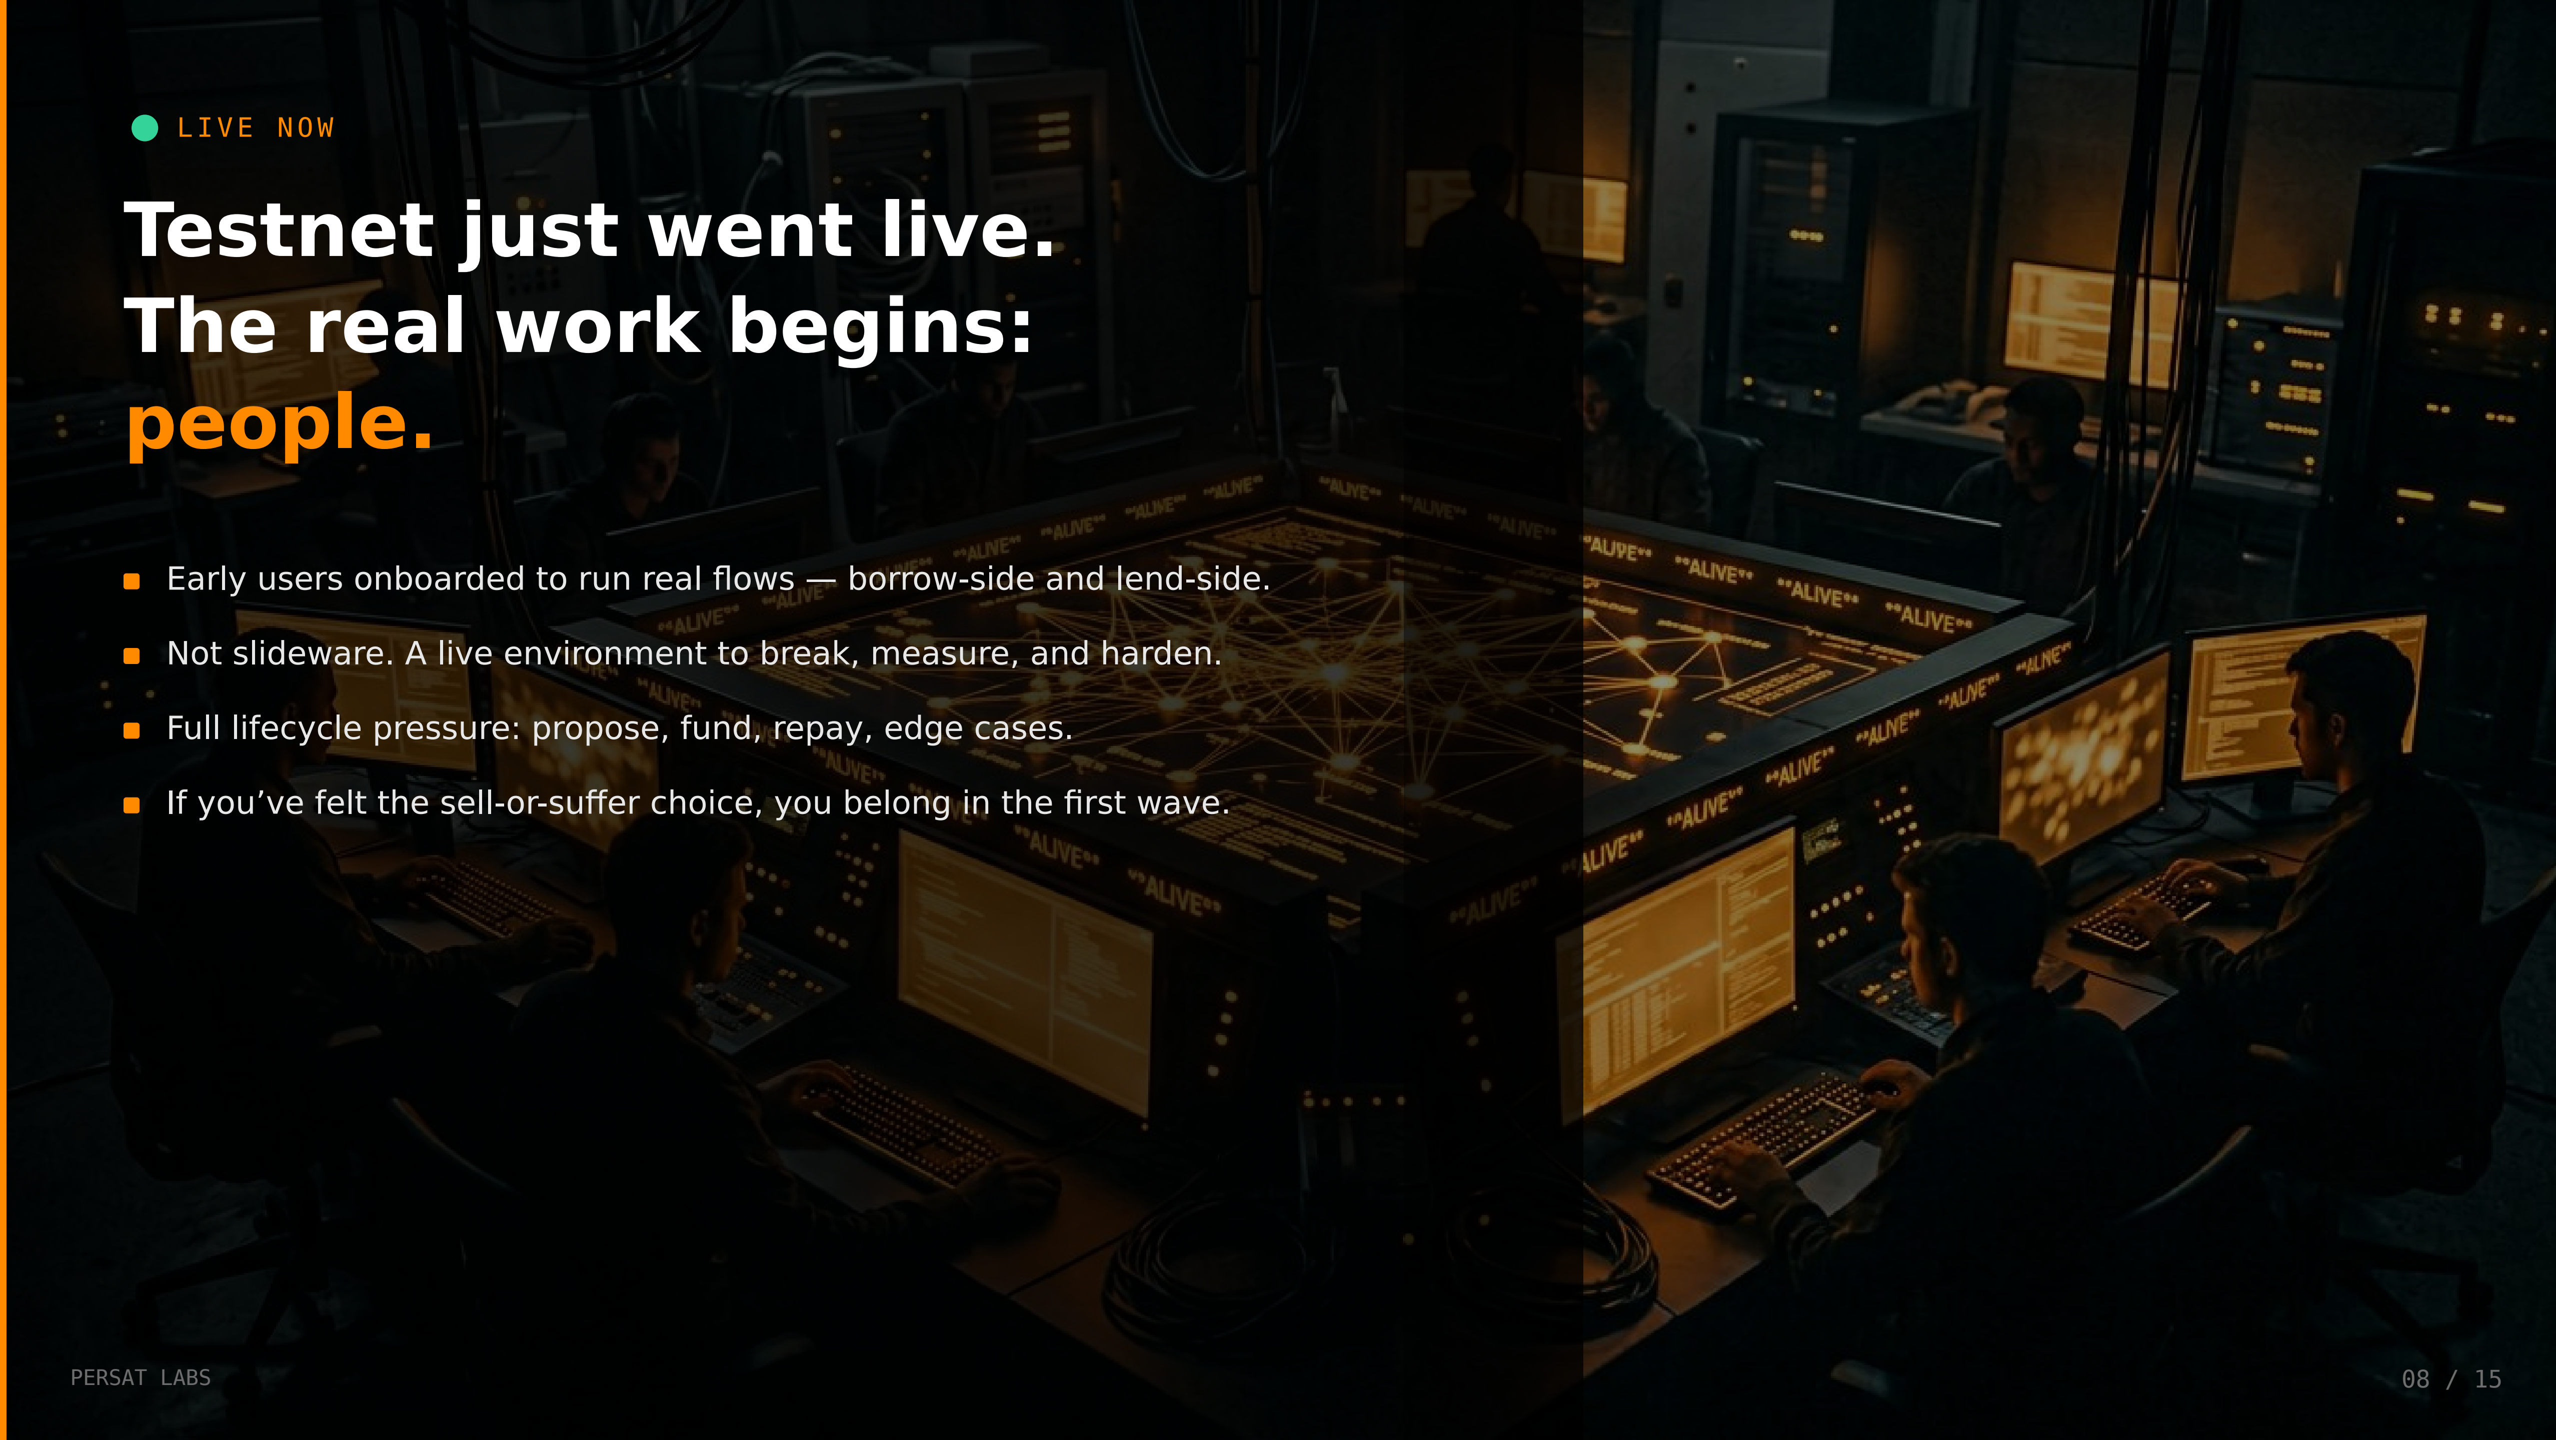
05 Repay and release — or default path with rules, not chaos.

Neither side relies only on the other's goodwill.

Bitcoin is our wedge.
Credit is our destination.

- We pilot on Bitcoin because it is liquid, global, and emotionally charged.
- Not a Bitcoin-lending brand forever — secured P2P credit infrastructure.
- Path: Bitcoin → broader digital collateral → multi-asset → asset-agnostic rails.
- Own the infrastructure layer — not every dollar of the market.

Bitcoin → Digital assets → Multi-asset → Asset-agnostic



LIVE NOW

Testnet just went live.
The real work begins:
people.

- Early users onboarded to run real flows — borrow-side and lend-side.
- Not slideware. A live environment to break, measure, and harden.
- Full lifecycle pressure: propose, fund, repay, edge cases.
- If you’ve felt the sell-or-suffer choice, you belong in the first wave.

MAINNET PATH

Mainnet isn’t a rewrite.
Three disciplined steps after proof.

01

Cluster & RPC

Mainnet-grade connectivity, monitoring, production RPC.

02

Canonical rails

Real tBTC / zBTC / USDC / USDT. Freeze architecture under test.

03

Production ops

Dedicated keeper keys, strip testnet-only surfaces, governance posture.

Testnet exists to make those three steps boring — because boring is how credit infrastructure should ship.

Audit-grade evidence and security gates before public real-funds promotion.

Not another pool.
Not another custodian.
Not a handshake with no teeth.

Private lending

Trust the person. Enforcement is social or slow.

DeFi pools

Trust the algorithm. No negotiation. Pure machine.

Persat

Discover the counterparty + structure the relationship + secure the transaction.

White space: P2P credit discovery × onchain secured enforcement.

MARKET

Trillions sit idle — not from apathy, from §missing rails.

DIRECTION

Idle digital capital

Bitcoin and stables represent enormous value that cannot safely become credit without custody or chaos.

- Idle capital is frozen intention: liquidity and yield without self-betrayal.
- Strategy: BTC-backed P2P wedge → multi-asset → asset-agnostic rails.
- Own the infrastructure layer — not the whole pie.
- Estimates are directional research — not claims of capture.

ORIGIN

Built by people who felt the trap.

David Obiokafor — Founder & CEO

- Lived the “I need liquidity against BTC” problem.
- Rejected custody as the price of access.
- Years refining marketplace + trust layer.
- Problem conviction · research · iteration leadership.

Prince N. Michael — Co-founder & CTO

- Turned conviction into executable product and architecture.
- Robotics & AI builder background.
- Product · architecture · shipping.
- Technical spine of Persat.

Domain scar tissue + technical spine. Not tourists in the problem.

TEAM

Domain conviction + technical execution.

DO

David Obiokafor

FOUNDER & CEO

Problem conviction · research · iteration

THE DOOR

Get in before credit gets **rebuilt without you.**

Early users

Join testnet onboarding. Borrow or lend in a controlled live environment. Help forge the rails you'll want on mainnet.

Partners & capital

Aligned partners who understand credit infrastructure is earned in public testnet, then cut over with discipline.

Live testnet → Early cohort proof → Audit-grade gates → 3-step mainnet → Scale

Keep what you believe in.
Access what you need.
Enforce what you agree.

Persat Finance — the marketplace and trust layer for onchain credit.

Testnet live. Early users welcome.
Mainnet, three steps after the truth comes back from the field.
